

Please follow these instructions: -

You will have to create a Lotmaps section on a web page.

Create a page named [Lotmap.aspx](#) in an ASP.NET 4.0 or 4.5 Webforms website project

Create a database locally on your computer using Microsoft SQL Server/Express named "[BCTest](#)"

Create a table named "[Lots](#)"

Create fields in the Lots tables for storing the Lot Number, co-ordinates and any field you find necessary.

Use LINQ 2 SQL to extract lot data from database

Create a Web Service to get Lots information

Use JQuery & Ajax (on client side) to add lots on the webpage

After you're done with the test, email me ([shanew@blairandco.ca](mailto:shanew@blairandco.ca)) the Entire Project zipped and the "[BCTest](#)" database. You could send me the script file (.sql) or a backup file for the database. I have attached all the required files in the email. Good luck

Your End Result will look something like this. (Don't worry about the red colors, make them all green)
